## GETTING STARTED

This problem set has two parts. Part A deals with encryption, a very important concept in computer science. Part B is a set of problems designed to help you practice writing recursive functions.

Download and save ProblemSet5.zip (/static/content-mit-600x~2012_Fall/files/templates/ProblemSet5.7065d459205e.zip). This zip archive includes the following files:

- `ps5_encryption.py`:

  Skeleton code you'll fill in for Part A of the problem set.

- `words.txt`:

  A list of English words

- `ps5_pseudo.txt`:

  Pseudocode for Problem 2. We urge you to **not** look at this file until you reach Problem 2 and read the instructions contained there.

- `story.txt`:

  An encoded story

- `ps5_recursion.py`:

  Skeleton code for Part B of the problem set.

Load `ps5_encryption.py` into a Python environment without making any modifications to it, in order to ensure that everything is set up correctly. The code that we have given you loads a list of words from a file. If everything is okay,

after a small delay, you should see the following printed out:

```
Loading word list from file...
55909 words loaded.
```

If you see an `IOError` instead (e.g., `No such file or directory`), you should change the value of the `WORDLIST_FILENAME` constant (defined near the top of the file) to the complete pathname for the file `words.txt` (this will vary based on where you saved the file).

The file `ps5_encryption.py` has a few functions already implemented that you can use while writing up your solution. You can ignore the code between the following comments, though you should read and understand everything else:

```
# -----------------------------------
# Helper code
# (you don't need to understand this helper code)
```

```
. . .
# (end of helper code)
# ---------------------------------
```
